## CONVERSION FACTORS

<u>Multiply</u>	<u>By</u>	<u>To obtain</u>
acre-foot	1,233	cubic meter
cubic foot per second	0.0283	cubic meter per second
foot per mile	0.1894	meter per kilometer
mile	1.609	kilometer

Temperature can be converted to degrees Fahrenheit ( $^{\circ}\text{F}$ ) or degrees Celsius ( $^{\circ}\text{C}$ ) by the following equations:

$$^{\circ}\text{F} = 9/5 \left( ^{\circ}\text{C} \right) + 32$$

$$^{\circ}\text{C} = 5/9 \left( ^{\circ}\text{F}-32 \right)$$

SELECTED WATER-QUALITY DATA FOR RAPID CREEK BASIN,

SOUTHWESTERN SOUTH DAKOTA, 1946-90

By Joyce E. Freeman and Stephen C. Komor

ABSTRACT

This report presents water-quality data for 42 sites within the Rapid Creek basin, southwestern South Dakota. Selected water-quality data collected by the U.S. Geological Survey since 1946 and by the South Dakota Department of Environment and Natural Resources since 1967 are presented in tabular form. Boxplots display monthly data for five parameters (discharge, specific conductance, dissolved nitrite plus nitrate, total ammonia plus organic nitrogen, and total phosphorous) at three sites on Rapid Creek. Scatter plots display the same parameters for a synoptic survey accomplished during water year 1989 at 17 sites on or adjacent to Rapid Creek.

INTRODUCTION

Background

Rapid Creek is the primary source of drinking water for Rapid City, Ellsworth Air Force Base, an unincorporated area in Rapid Valley, and for irrigation water in Rapid Valley. Water-quality data have been collected within the Rapid Creek basin by Federal, State, and municipal agencies since 1946.

Local water officials are concerned that water quality in Rapid Creek degrades as it flows through the City. In the spring of 1987, the City experienced taste and odor problems in its finished drinking water supply during the peak demand season. Although the cause was never thoroughly understood, the taste and odor problems were associated with Rapid Creek and Canyon Lake.

In a letter dated June 9, 1989, the State of South Dakota identified Rapid Creek as a high priority stream for nonpoint water-quality investigation and remediation. This report was funded by the State of South Dakota and the West Dakota Water Development District in order to examine existing water quality data for evidence of nonpoint pollution.

Nonpoint-source pollution is from sources that cannot be identified as isolated points. Examples of potential nonpoint-source pollution within the Rapid Creek basin include defective residential septic systems, urban runoff in Rapid City, biochemical by-products of lake eutrophication, and agricultural chemicals and animal wastes from farms and ranches in the watershed downstream of Rapid City.

A systematic compilation of existing water-quality data may aid in identifying types, locations, and sources of pollutants in Rapid Creek. The water-quality compilation also may be useful for siting and designing pollution abatement measures.

### Purpose and Scope

The purpose of this data report is to collate and present selected water-quality data for field measurements of selected properties, major ions, nutrients, selected trace elements, organic compounds, bacteria, and sediment for selected sites within the Rapid Creek basin downstream of Pactola Reservoir. This report presents selected water-quality data collected by the U.S. Geological Survey (USGS) since 1946, and by the South Dakota Department of Environment and Natural Resources (DENR) since 1967. Boxplots and scatter plots display changes in contaminant concentrations with respect to stream location, season, and stream discharge. All data tabulated in this report were analyzed according to U.S. Geological Survey (Friedman and Fishman, 1989) and U.S. Environmental Protection Agency (1979) laboratory standards.

Additional water-quality data for storm-runoff events within the Rapid Creek basin are presented in Goddard and others (1989). Stewart and others (1989) provide a general assessment of water-quality and potential pollution sources for Rapid Creek and Canyon Lake. Sources of additional water-quality information for Rapid Creek are summarized in Zogorski and others (1990).

### DESCRIPTION OF RAPID CREEK BASIN

Rapid Creek is a perennial stream, which originates west of Rapid City in the Black Hills of South Dakota (fig. 1). The upstream reach of Rapid Creek, from the origination near Crooks Tower to the city limits of Rapid City, has an average gradient of about 48 feet per mile, and is comparatively narrow and fast-running. The bed of the creek consists of sand, gravel, and cobbles derived from surrounding surface exposures of crystalline rock, sandstone, and limestone. In Rapid City, Rapid Creek turns to the southeast and the downstream reach flows for about 70 miles to its mouth at the Cheyenne River near Creston, South Dakota. Within this reach, the gradient is about 13 feet per mile, and stream velocities are considerably less than for the upstream reach. The creek meanders through a broad alluvial valley that is floored by easily erodible shales and has a muddy bottom (Goddard and others, 1990).

Deerfield Reservoir and Pactola Reservoir are the two largest reservoirs in the Rapid Creek basin. Deerfield Reservoir is located about 53 miles upstream of Rapid City on Castle Creek, a major tributary of Rapid Creek and has an active capacity of 15,504 acre-feet (U.S. Bureau of Reclamation, written commun., 1985). Pactola Reservoir is located on Rapid Creek about 21 miles upstream of Rapid City and has an active capacity of 54,955 acre-feet (U.S. Bureau of Reclamation, written commun., 1988). Canyon Lake is a 27-acre impoundment located on the western edge of Rapid City (Stewart and others, 1989).

Additional information on basin characteristics, including geology and hydrogeology, physiography and climate, land use and vegetation, reservoirs, and water use are included in a report by Driscoll and Zogorski (1990).

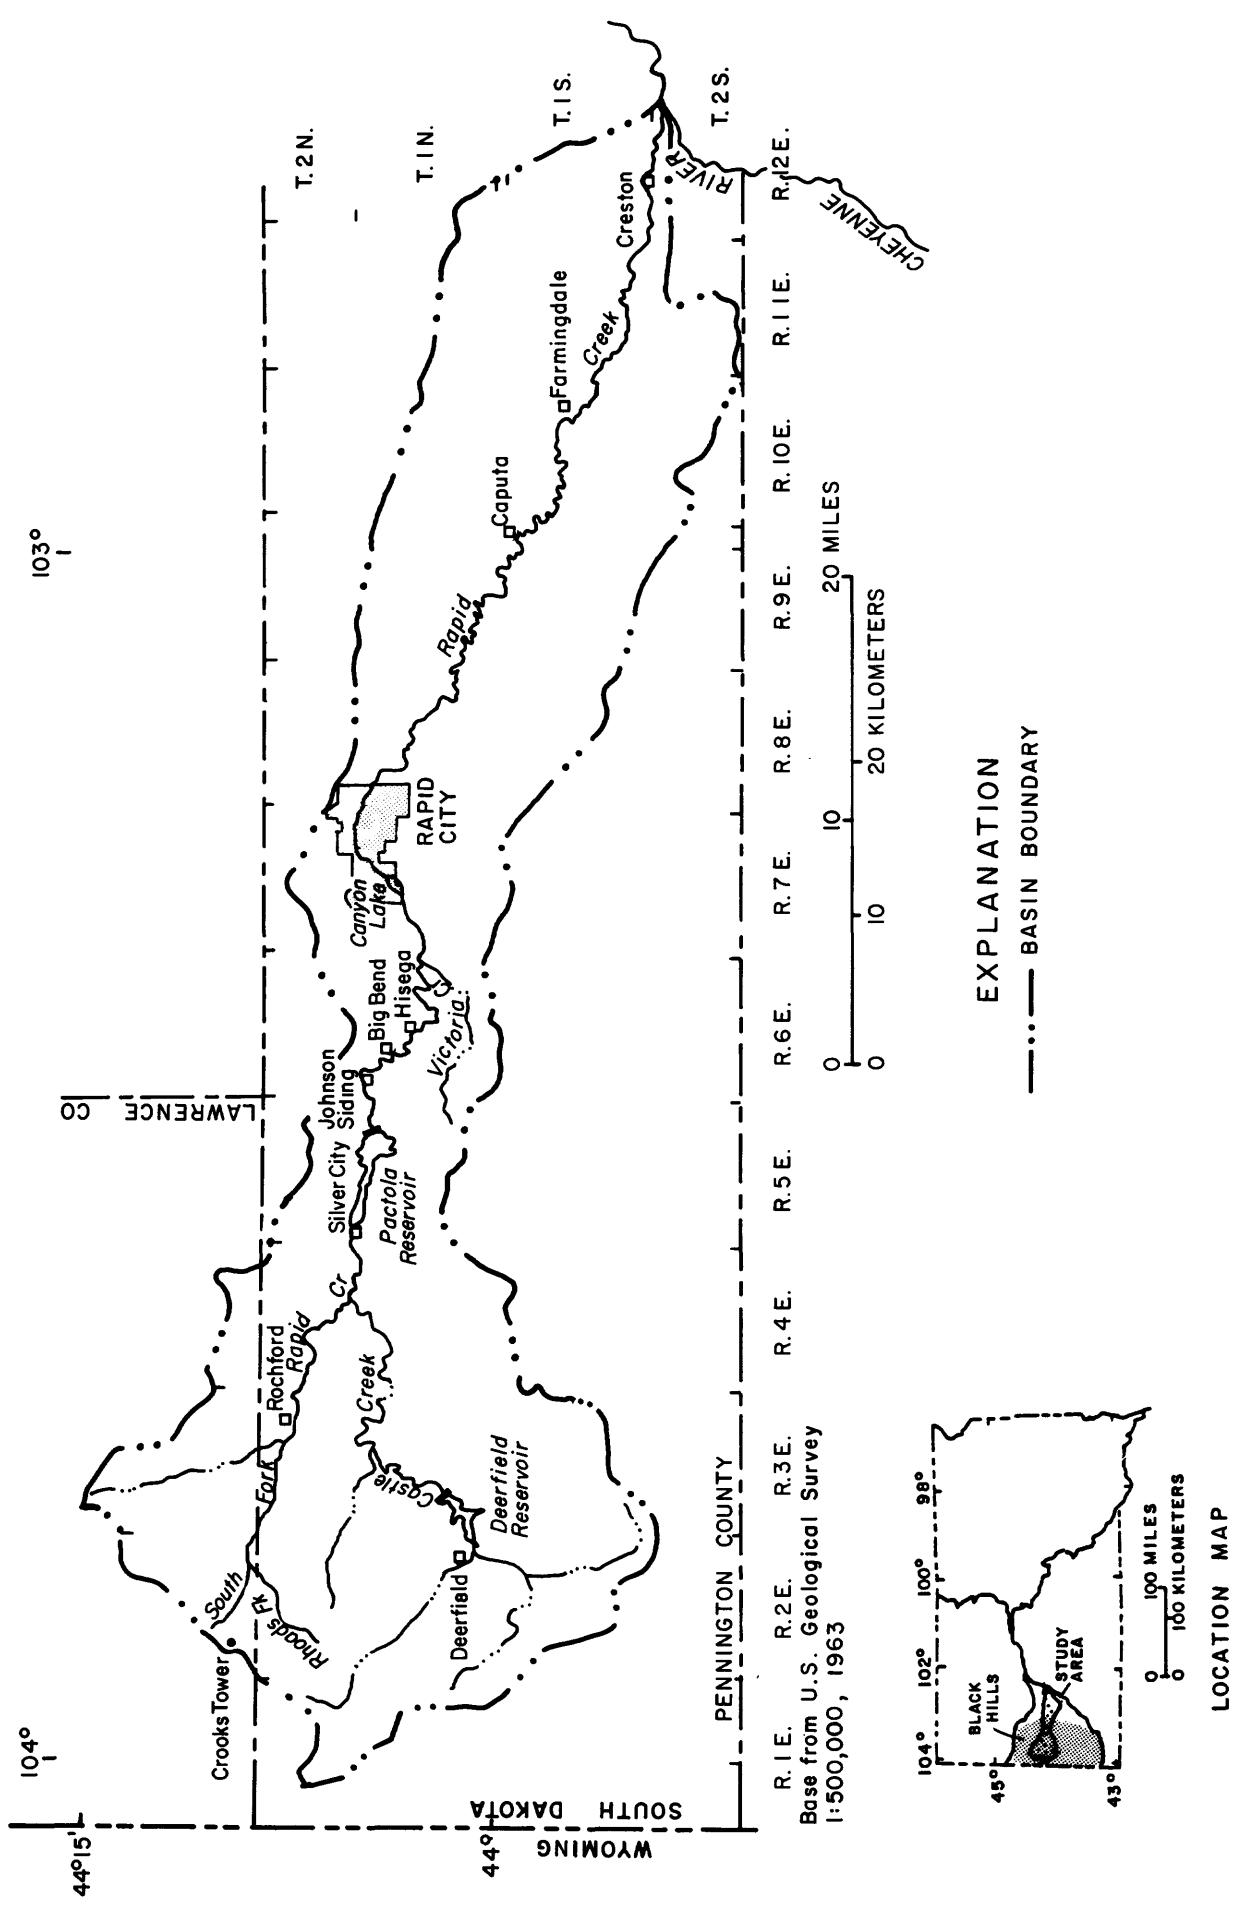

Figure 1.--Location of Rapid Creek basin.

## DESCRIPTION OF WATER-QUALITY DATA

Data from 42 water-quality sampling sites within the Rapid Creek basin (table 1) are included in this report. Water-quality data for these sites were collected by the USGS and by the DENR. Most sampling sites are located on Rapid Creek, but some are located on springs, streams, or drainage ditches that are tributaries to Rapid Creek. The sites are concentrated near to and within Rapid City (fig. 2). Water-quality data collected by the USGS are archived in the National Water Data Storage and Retrieval System (WATSTORE), a computerized data-storage and retrieval system. Water-quality data collected by the DENR are archived in STORET, a computerized data system maintained by the U.S. Environmental Protection Agency. Because of the varying periods of record for the sample sites, caution should be exercised in the interpretation of the data presented in this report.

Water-quality data collected by the USGS for 38 of the stations provide most of the information summarized in this report (table 2 in the Supplemental Information section at the back of this report). Water-quality data collected and analyzed by the USGS for the National Urban Runoff Project (Goddard and others, 1989) are not included in table 2. The majority of the USGS data were collected at two sites: Rapid Creek below Pactola Dam (site 1, table 1) and Rapid Creek near Farmingdale (site 43, table 1).

Water-quality data were collected at Rapid Creek below Pactola Dam during the 1969-80 water years. Grab samples were collected approximately once per month for the period of record, and composite samples were obtained for physical and chemical properties including major ions, nutrients, and trace elements. A grab sample involves obtaining a single volume of water from the stream in a single effort. A composite sample generally involves taking incremental samples across the width of the stream and keeping the samples mixed homogeneously for lab analysis to ensure that each section of the stream is represented in the water sample. Concentrations of boron were measured during the 1969-79 water years, and iron and manganese concentrations were measured during the 1969-71 water years. Temperature and specific conductance were measured daily during the entire period of record (Zogorski, 1990).

Water-quality data were collected at Rapid Creek near Farmingdale for water years 1950, 1953, 1956-58, and 1969-80. All samples collected prior to 1969 were composited in proportion to discharge. Grab samples were collected during 1969-80, and additional composite samples were collected during 1969-73. Analyses were completed for physical and chemical properties, including major ions, nutrients, and trace elements. Concentrations of boron, iron, and manganese also were determined for many samples. Temperature and specific conductance were measured daily during the period of record (Zogorski, 1990).

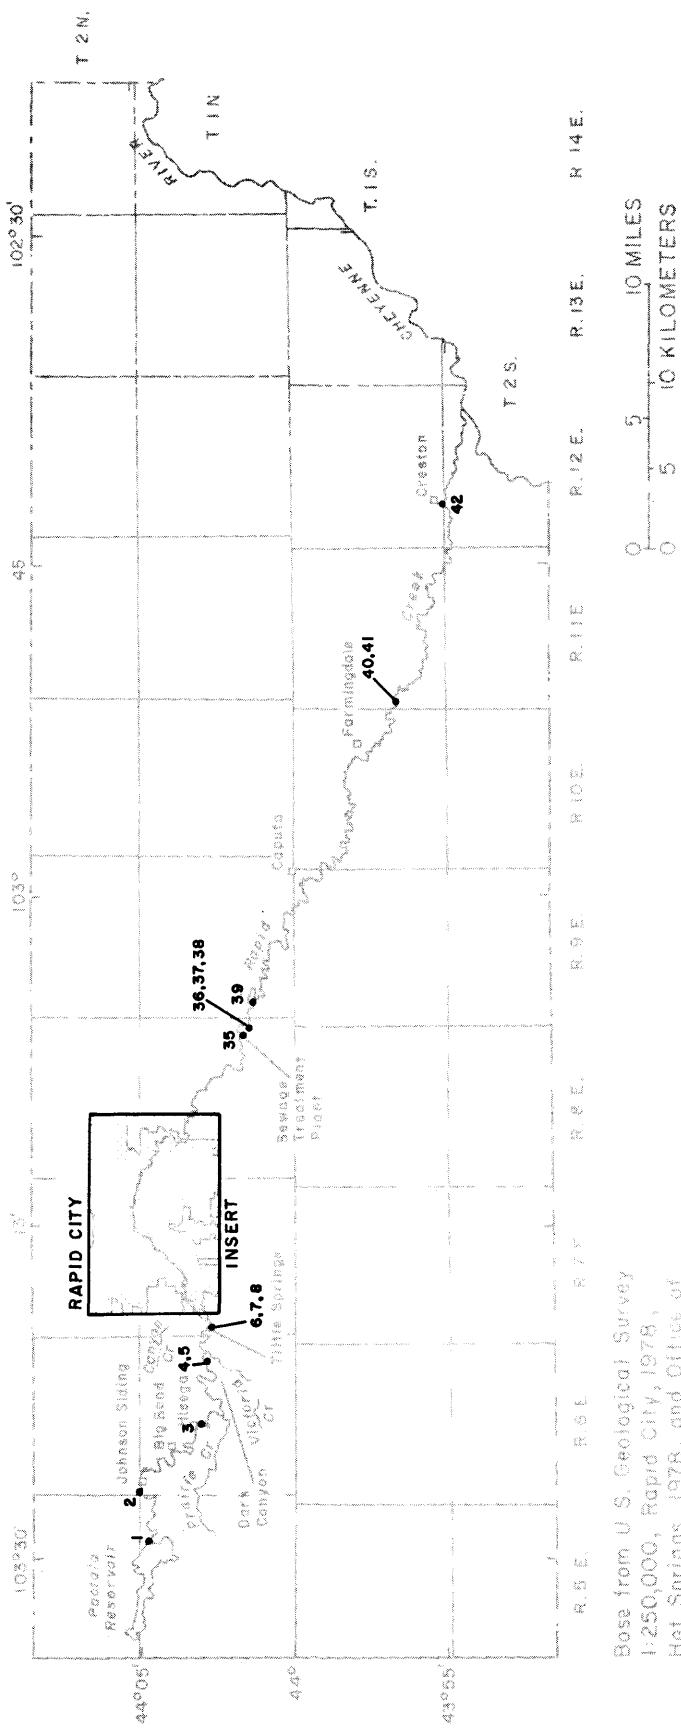

The other USGS sites have variable periods of record that begin in 1949. Water-quality data at most of these stations include physical properties (water temperature, specific conductance, pH, and dissolved oxygen), and many analyses include concentrations of major ions, nutrients, and selected trace elements.

## EXPLANATION

- <sup>2</sup> DATA-COLLECTION SITE--Number refers to site number listed in table 1

Base from U. S. Geological Survey  
1:250,000, Rapid City, 1978,  
Hot Springs, 1978, and Office of  
the City Engineer, Rapid City, 1981.

6

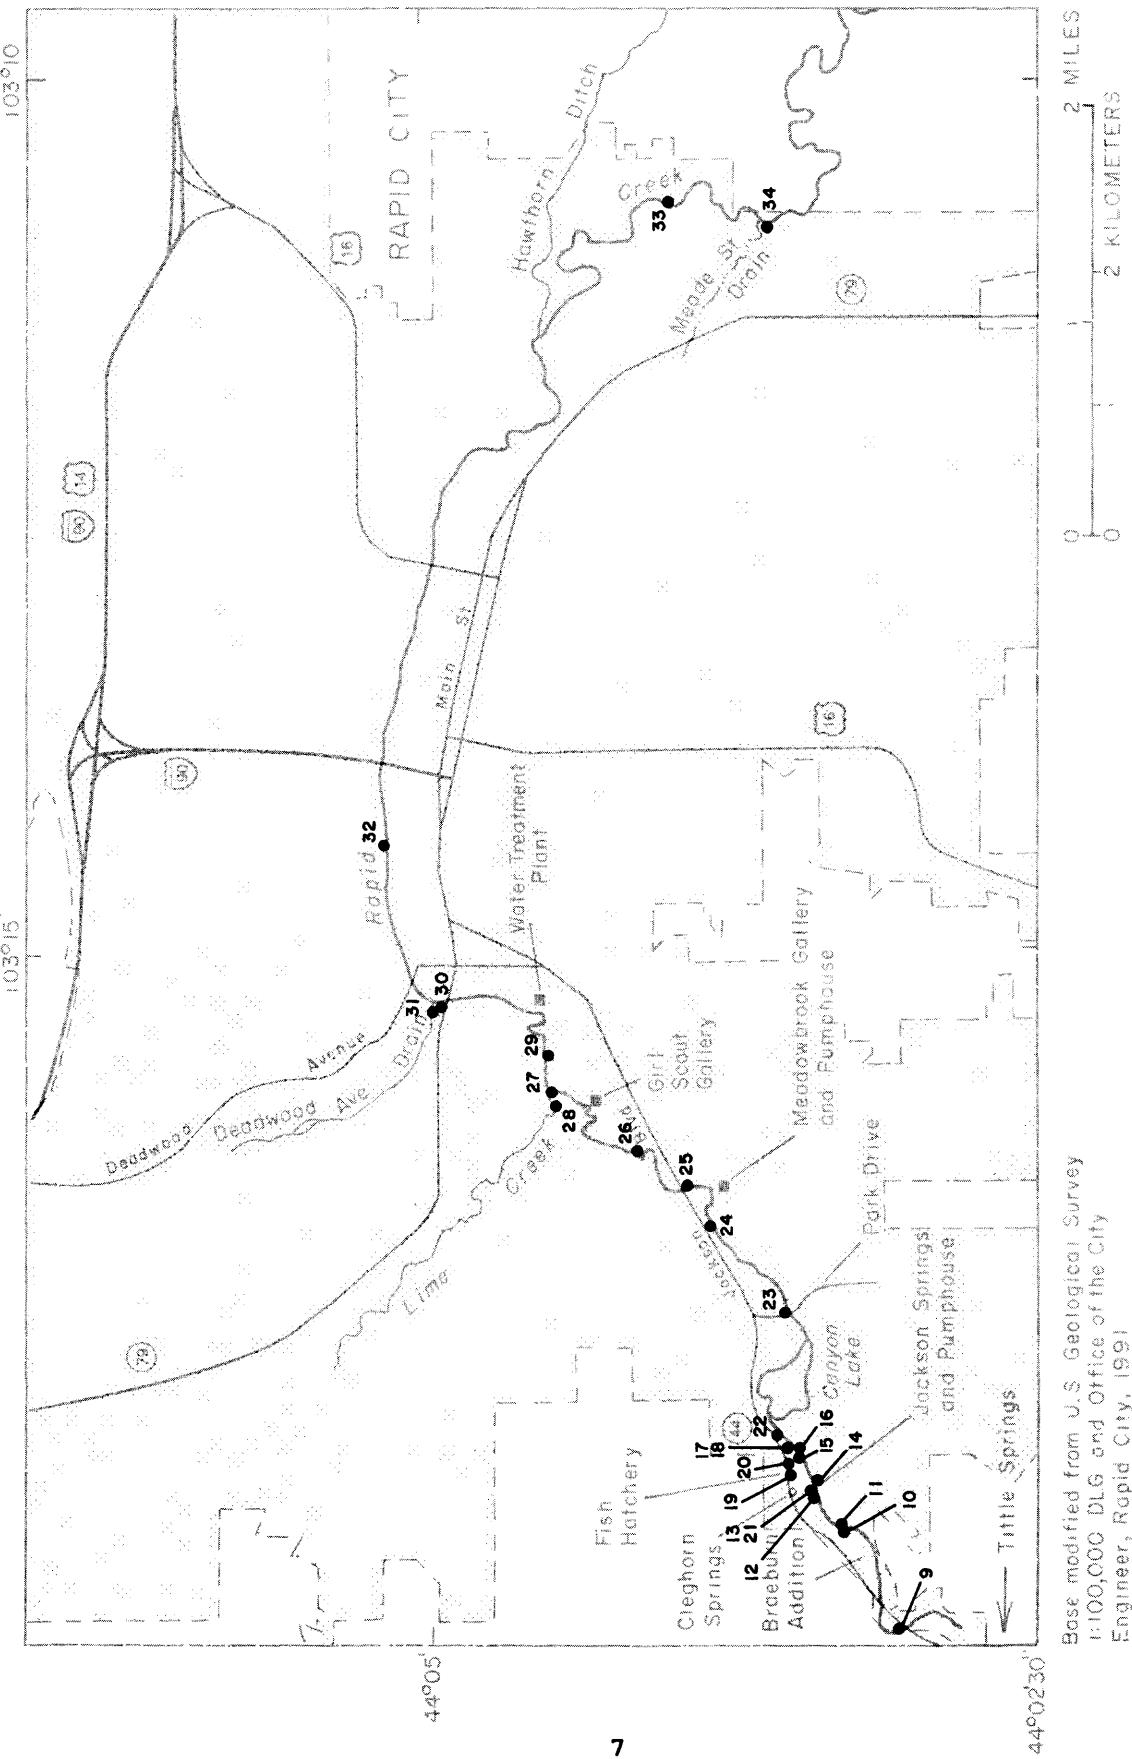

Figure 2.—Locations of water-quality sampling sites within the Rapid Creek basin downstream of Pactola Reservoir--Continued.

Base modified from U.S. Geological Survey  
1:100,000 DLS and Office of the City  
Engineer, Rapid City, 1991

The DENR collected water-quality data at four sites on Rapid Creek between Pactola Reservoir and the mouth. The data (Mark McCarty, South Dakota Department of Environment and Natural Resources, written commun., 1990) are presented in table 3 in the Supplemental Information section. Monthly water samples were collected at most of these sites, beginning in 1967. Water-quality parameters measured at these sites generally include physical properties (water temperature, specific conductance, dissolved oxygen, bacteria, pH, and fecal coliform) and chemical properties including concentrations of alkalinity, calcium, magnesium, and sodium, and various species of nitrogen and phosphorous. All major cations and major anions, iron, manganese, and fecal streptococcus bacteria were determined for some samples (Zogorski, 1990).

The USGS conducted a synoptic survey, primarily for nutrient concentrations, within the Rapid Creek basin during the 1989 water year (table 4 in the Supplemental Information section). At four times during the water year when discharge was less than 100 cubic feet per second, water samples were collected within 1- or 2-day periods at 17 sites along an 84-mile reach of Rapid Creek between Pactola Dam and Farmingdale. Sampling was conducted to provide information on seasonal, as well as spatial, variations of nutrient concentrations. Discharge at each station also was measured during the sampling periods.

The USGS also collected samples during a 14-hour period at Cleghorn Springs Main Channel at the Fish Hatchery (table 5 in the Supplemental Information section). These data were collected during the cleaning of the fish hatchery raceway.

Surface-water-quality data in the Rapid Creek basin also are available from the U.S. Forest Service (five stations on the Rapid Creek main stem upstream of Rapid City), the City of Rapid City, the West Dakota Water Development District, and the South Dakota Department of Game, Fish and Parks (Zogorski and others, 1990). Because of different laboratory standards and the short duration of some of these data-collection efforts, the data are not included in this report. U.S. Forest Service data are available at the U.S. Forest Service office in Custer, South Dakota.

#### PRESENTATION OF WATER-QUALITY DATA

Boxplots for five parameters (discharge, specific conductance, dissolved nitrite plus nitrate, total ammonia plus organic nitrogen, and total phosphorous) are presented for three USGS sites on Rapid Creek (figs. 3-7 in the Supplemental Information section). Data collected for the National Urban Runoff Project (Goddard and others, 1989) are included in the boxplots.

When sites have less than five values per month for a particular water-quality parameter, the individual values are plotted as open circles. When more than four measurements are available, box and whisker symbols are used. In these symbols, the dot at the lowest point on the vertical line (whisker) indicates the minimum value, the bottom edge of the box represents the 25-percentile value, the horizontal line within the box represents the median value, the top edge of the box represents the 75-percentile value, and the dot at the top of the vertical line (whisker) represents the maximum value.

A horizontal line across the entire figure represents the laboratory reporting limit. Single data values at or below the laboratory reporting limit are plotted on the horizontal line. For total phosphorus at Rapid Creek above Canyon Lake (fig. 7), many of the data values were less than the laboratory reporting limit, and distributional parameters were estimated using a log-probability regression procedure (Helsel and Gillion, 1985). The estimated part of the box and whisker symbol below the reporting limit is indicated with a dashed line.

For dissolved nitrite plus nitrate (fig. 5), presentation of the data was complicated by multiple detection limits. At Rapid Creek above Canyon Lake, many detected concentrations were less than 0.1 mg/L (milligrams per liter), so samples reported as "<0.100" provided little useful information. For this reason, four "<0.100" values were discarded from the data set. Also, one value reported as "0.00" was discarded. At Rapid Creek near Farmingdale, a much larger number of dissolved nitrite plus nitrate values were greater than 0.100 mg/L. At this site, the reporting limit is displayed as 0.100 for all months but August when a more sensitive laboratory procedure was used and the reporting limit is displayed as 0.010. A value reported to be "0.00" for August was discarded from the data set.

For the USGS synoptic sampling, scatter plots are presented for five parameters (discharge, specific conductance, dissolved nitrite plus nitrate, total ammonia plus organic nitrogen, and total phosphorous) for 12 main stem sites and 5 tributary sites (figures 8-12 in the Supplemental Information section). Each sampling is represented by a separate symbol.

For discharge in figure 3, WATSTORE program W4422, "Daily Values Monthly and Annual Statistics" (Price and Meeks, 1977), was used. For all other parameters except phosphorus, percentile rankings were generated using the percentiles option of P-STAT<sup>1</sup> software. For total phosphorous at Rapid Creek above Canyon Lake (fig. 7), percentiles were generated using program AUTOMDL.F77 (Helsel and Gillion, 1985). All plots were generated using TELL-A-GRAF software.

#### SUMMARY

This report presents water-quality data for 42 sites within the Rapid Creek basin. Selected water-quality data collected by the USGS since 1946 and by the DENR since 1967 are presented in tabular form.

Boxplots present monthly data for five parameters (discharge, specific conductance, dissolved nitrite plus nitrate, total ammonia plus organic nitrogen, and total phosphorous) at three sites on Rapid Creek. Scatter plots display the same parameters for a synoptic survey accomplished during water year 1989 at 17 sites on or adjacent to Rapid Creek.

The plots attempt to display changes in concentrations with respect to stream location, season, and stream discharge. However, caution should be exercised in the interpretation of the boxplots because of the varying periods of record for the sites.

<sup>1</sup>Use of trade names in this report is for identification purposes only and does not constitute endorsement by the U.S. Geological Survey.

**SUPPLEMENTAL INFORMATION**

## **PLOTS OF DISCHARGE AND WATER-QUALITY DATA**

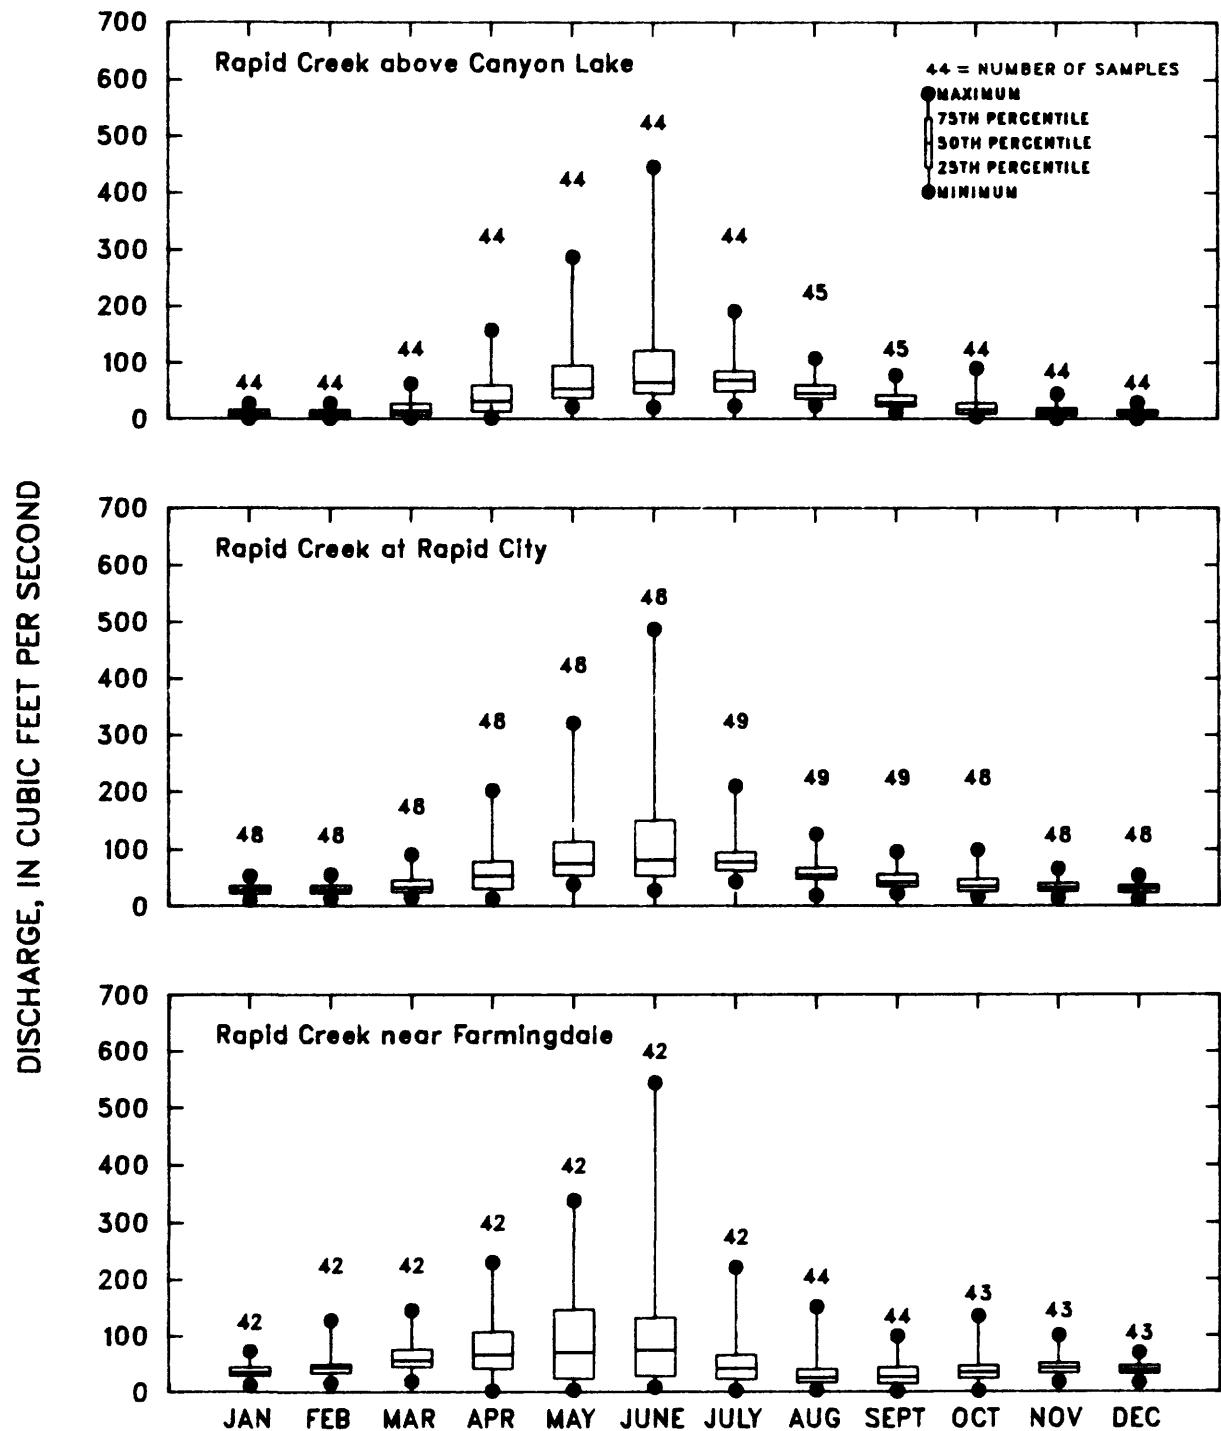

Figure 3.--Distribution of mean monthly discharge for three sites on Rapid Creek .

MICROSIEMENS PER CENTIMETER AT 25 °CELSIUS

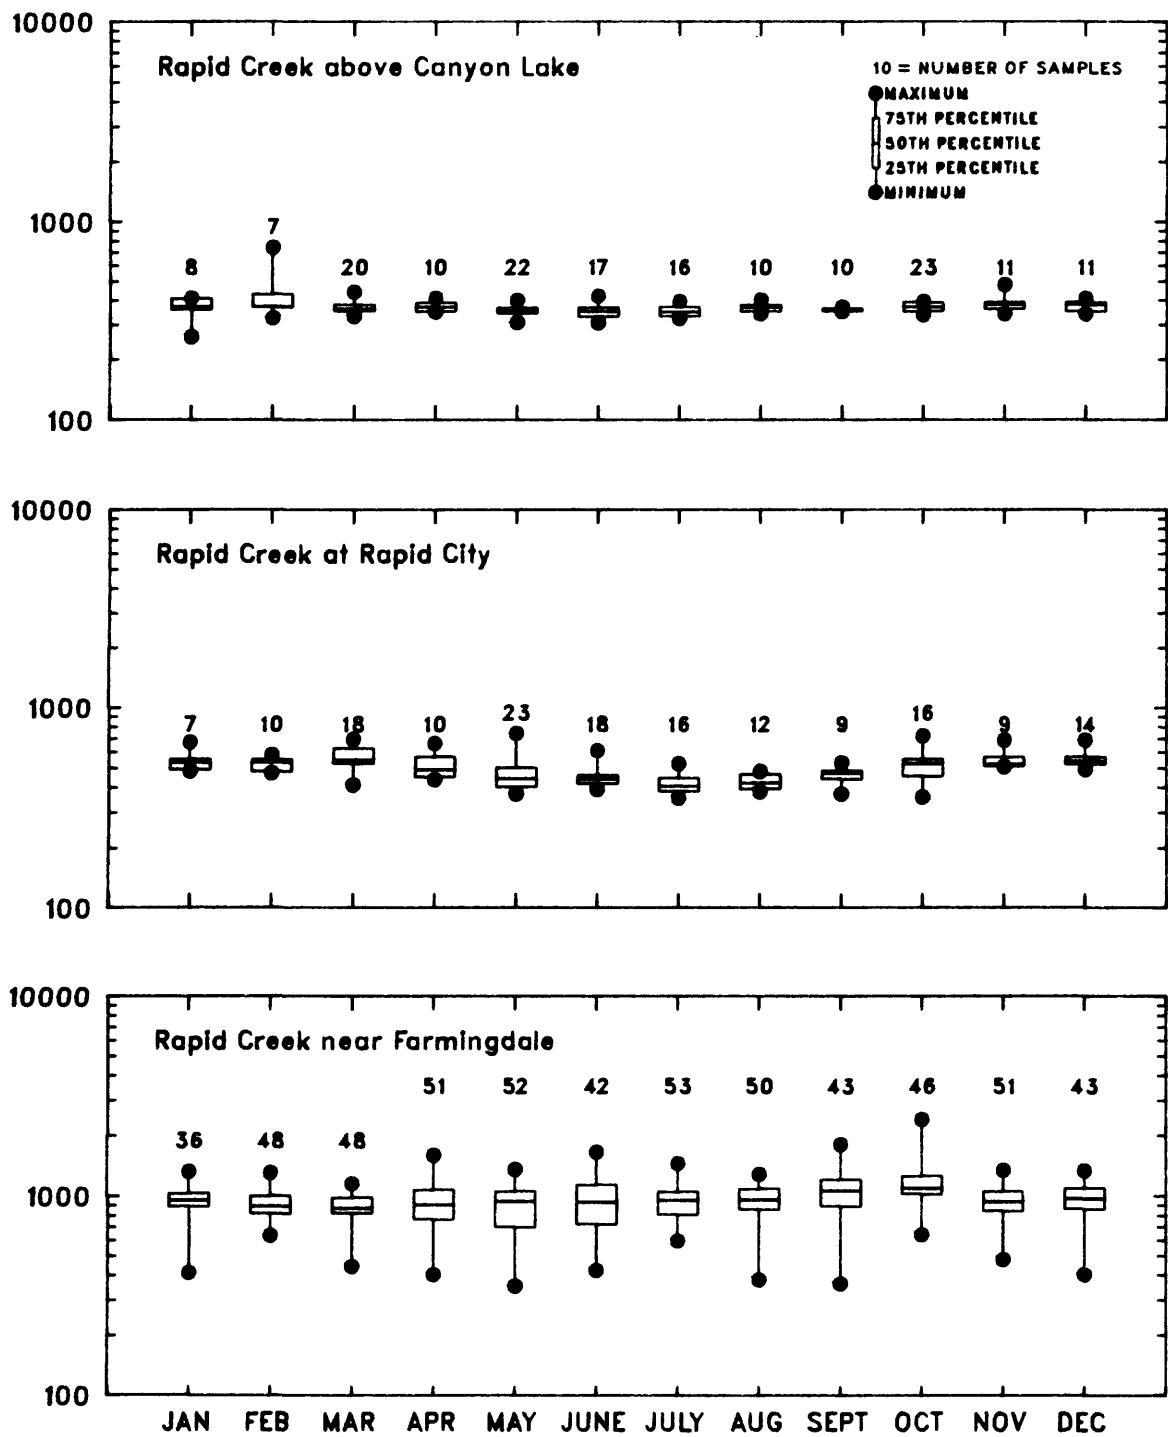

Figure 4.--Monthly distribution of specific conductance for three sites on Rapid Creek.

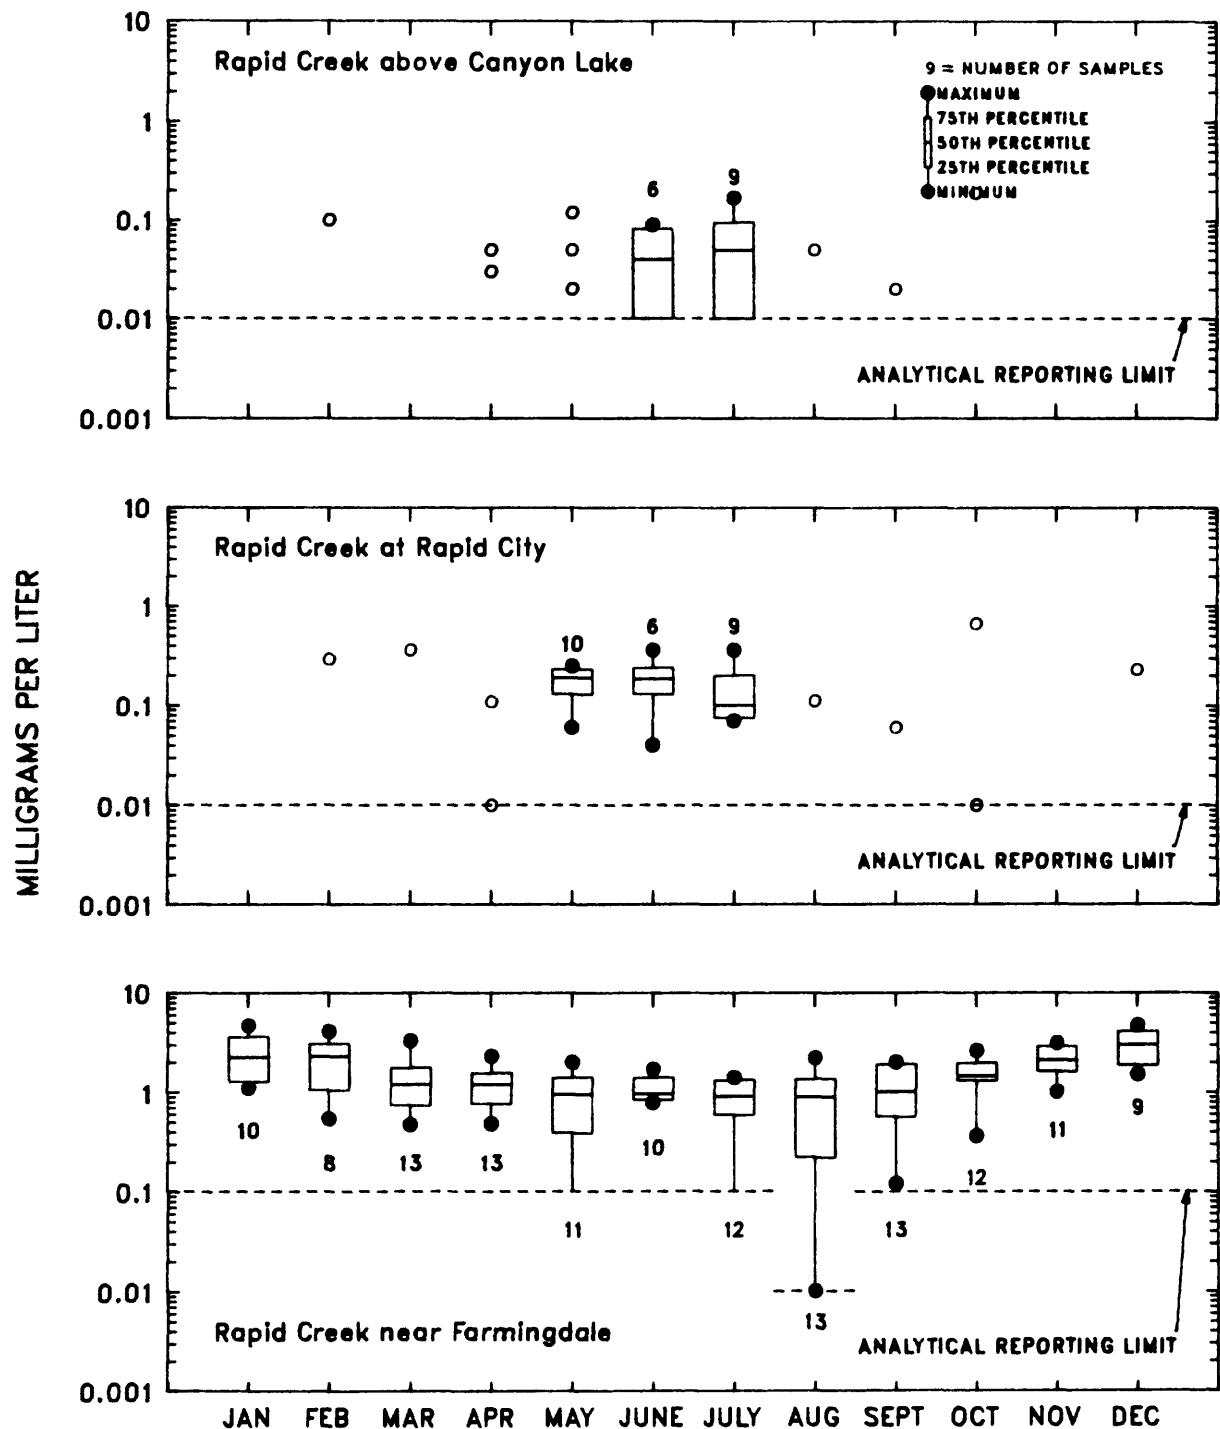

Figure 5.--Monthly distribution of dissolved nitrite plus nitrate (as nitrogen) for three sites on Rapid Creek.

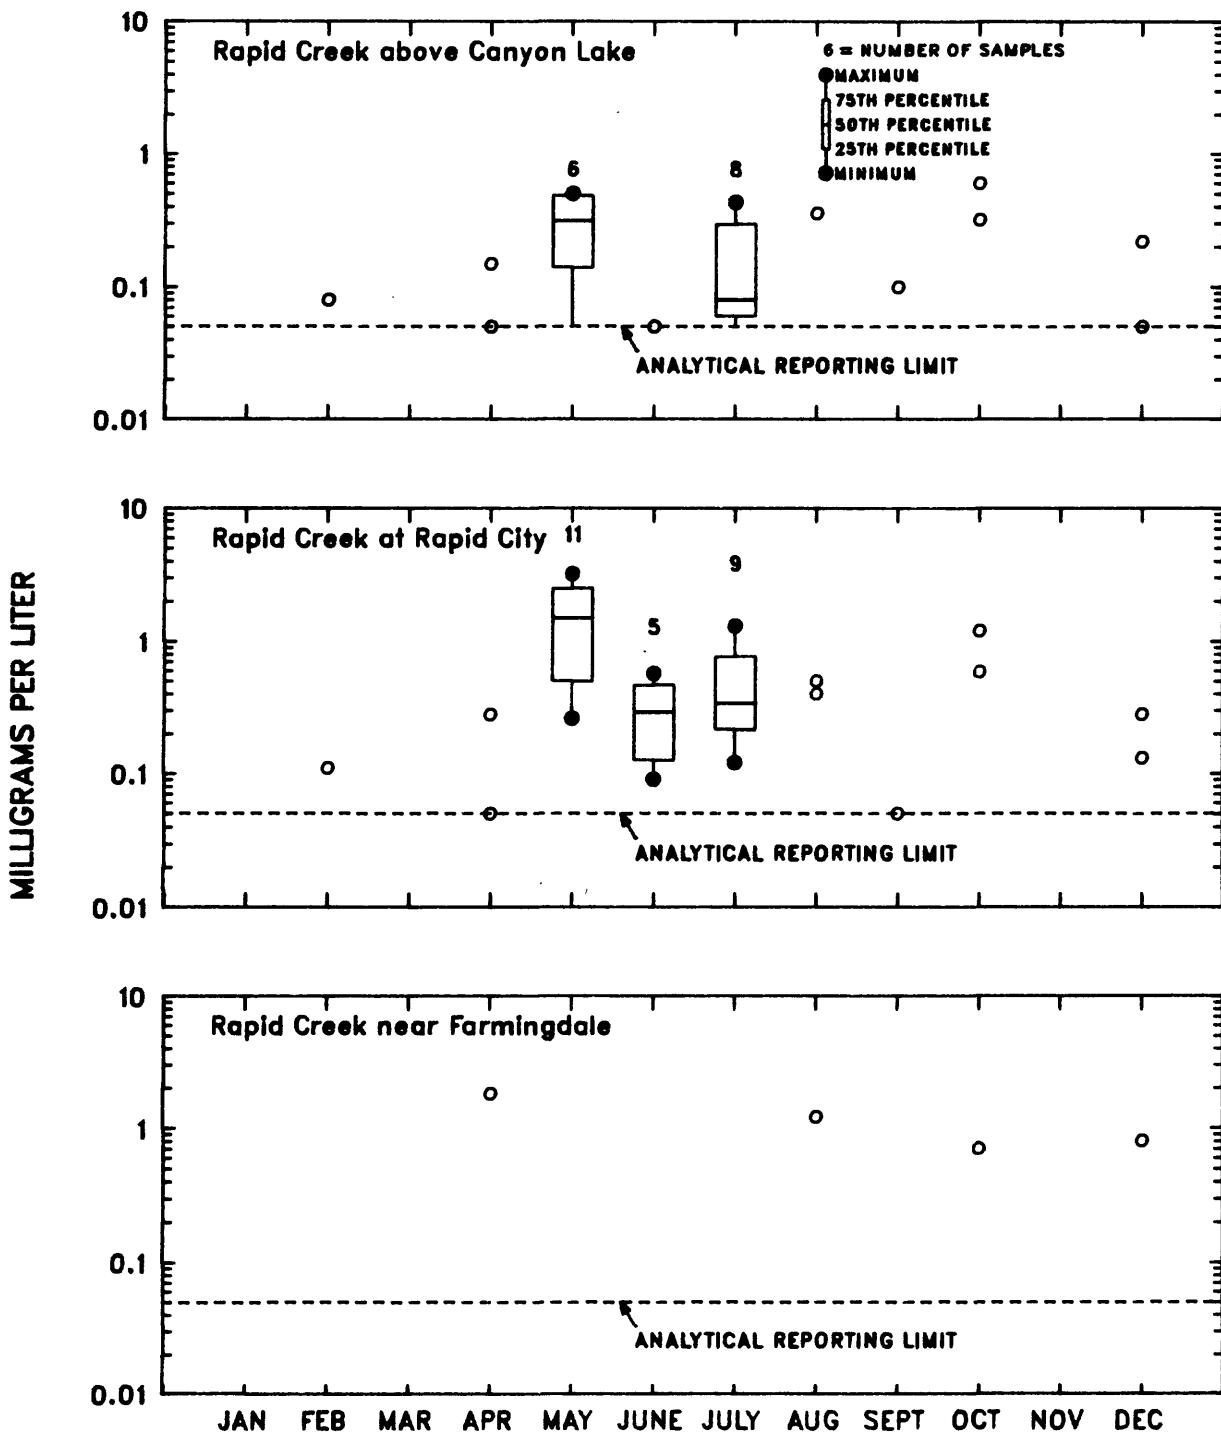

Figure 6.--Monthly distribution of total ammonia plus organic nitrogen for three sites on Rapid Creek.

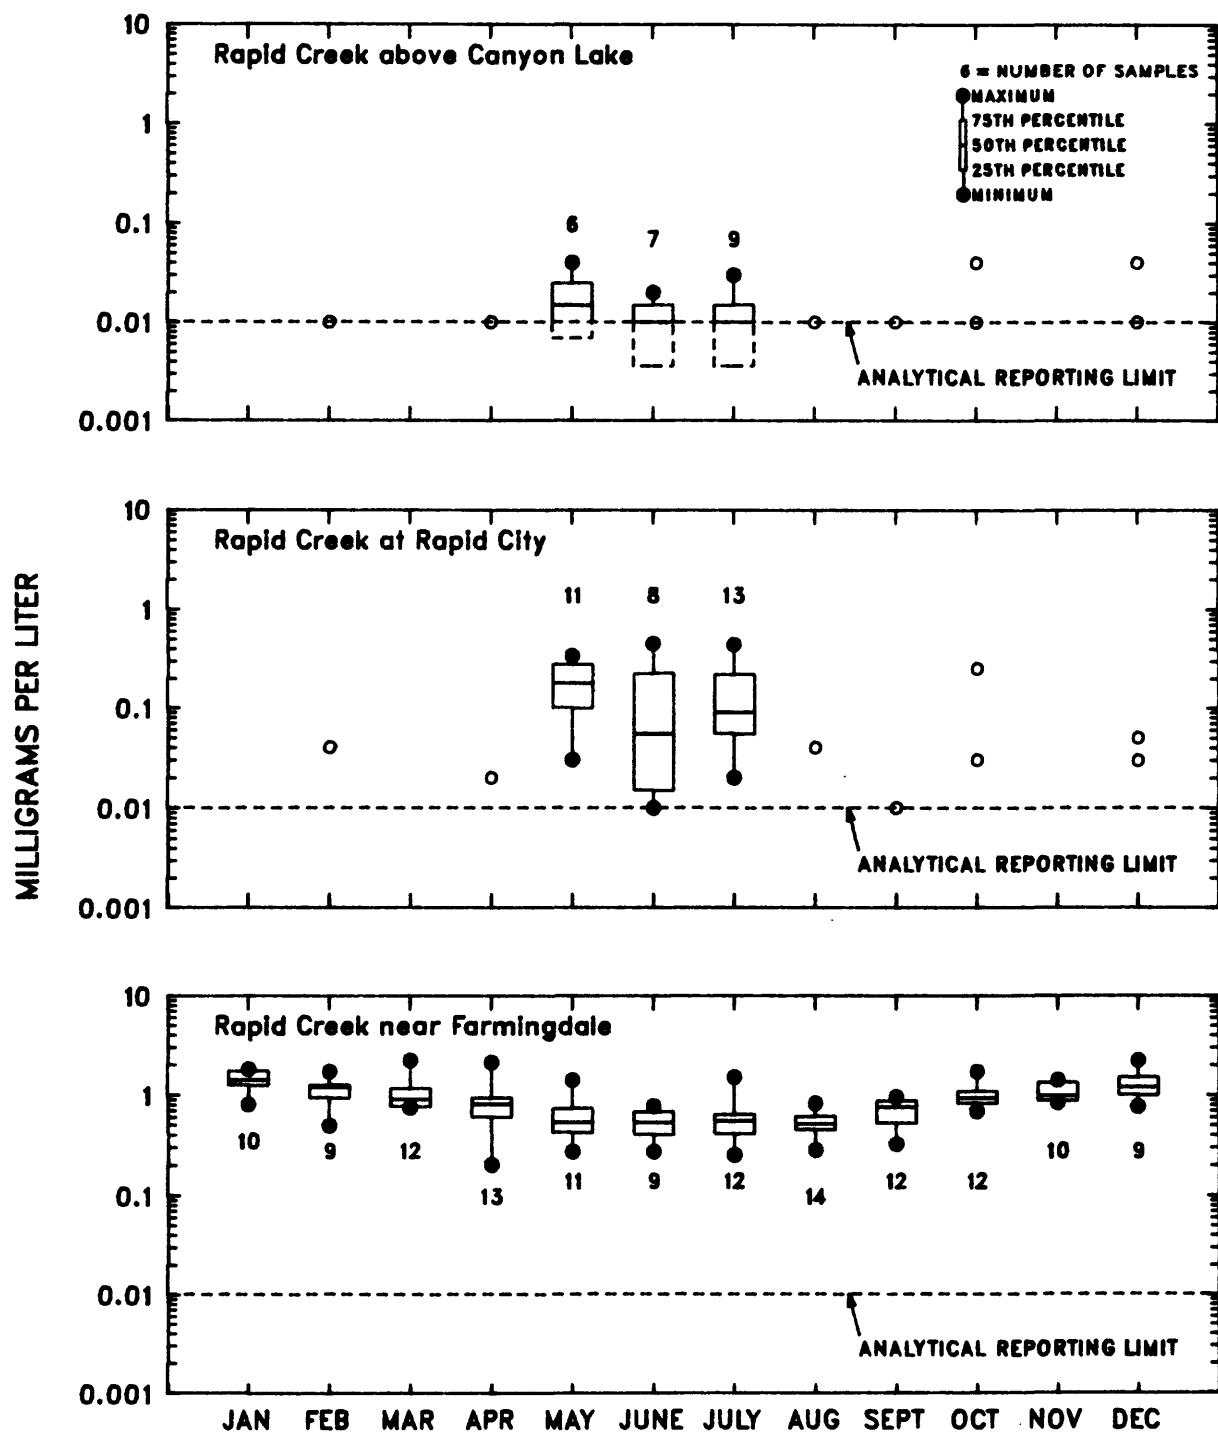

Figure 7.--Monthly distribution of total phosphorous for three sites on Rapid Creek.

DISCHARGE, IN CUBIC FEET PER SECOND

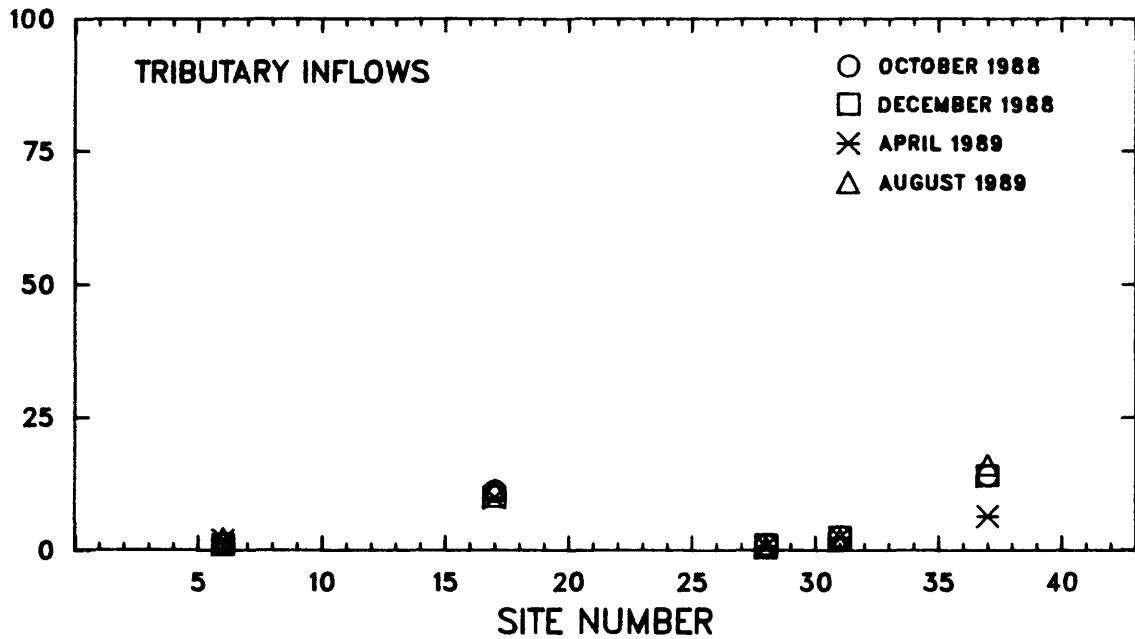

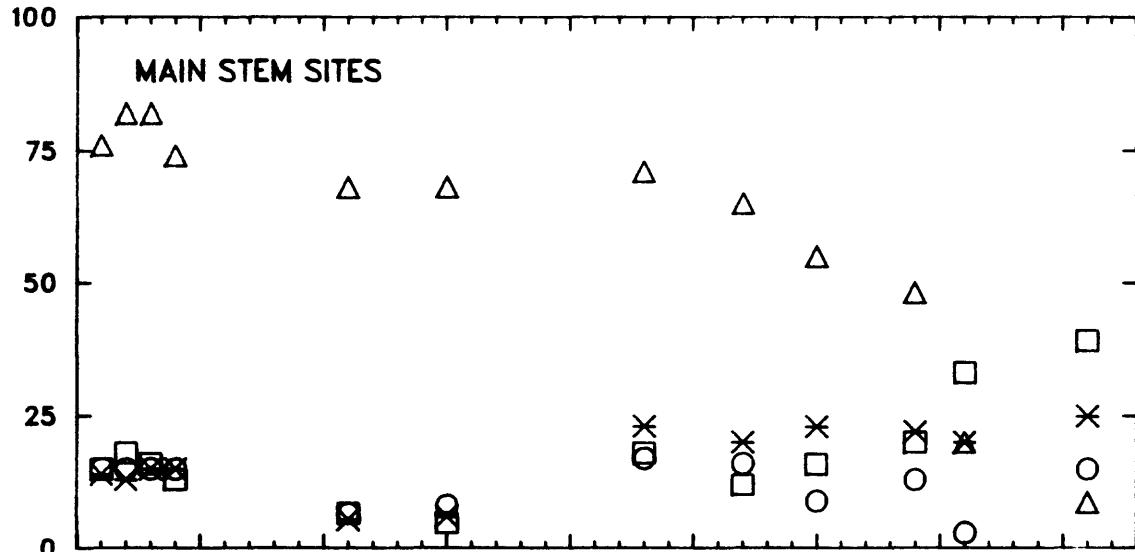

Figure 8.--Instantaneous discharge at synoptic sampling sites on and adjacent to Rapid Creek.

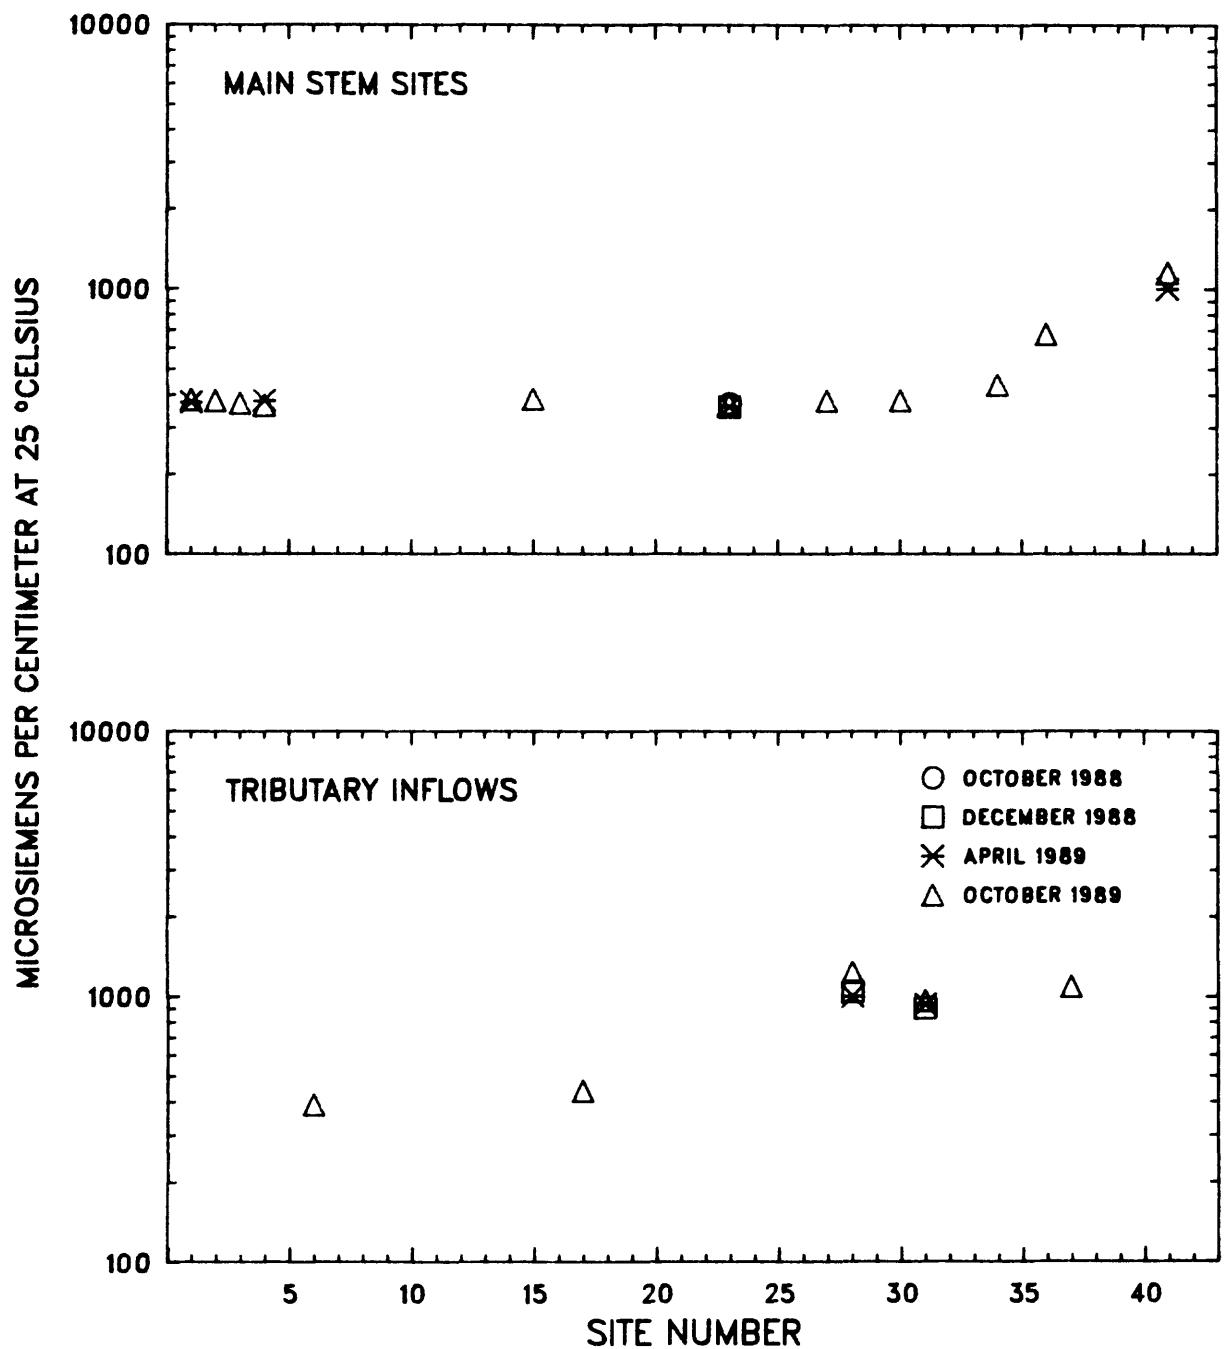

Figure 9.—Specific conductance for synoptic sampling of sites on and adjacent to Rapid Creek.

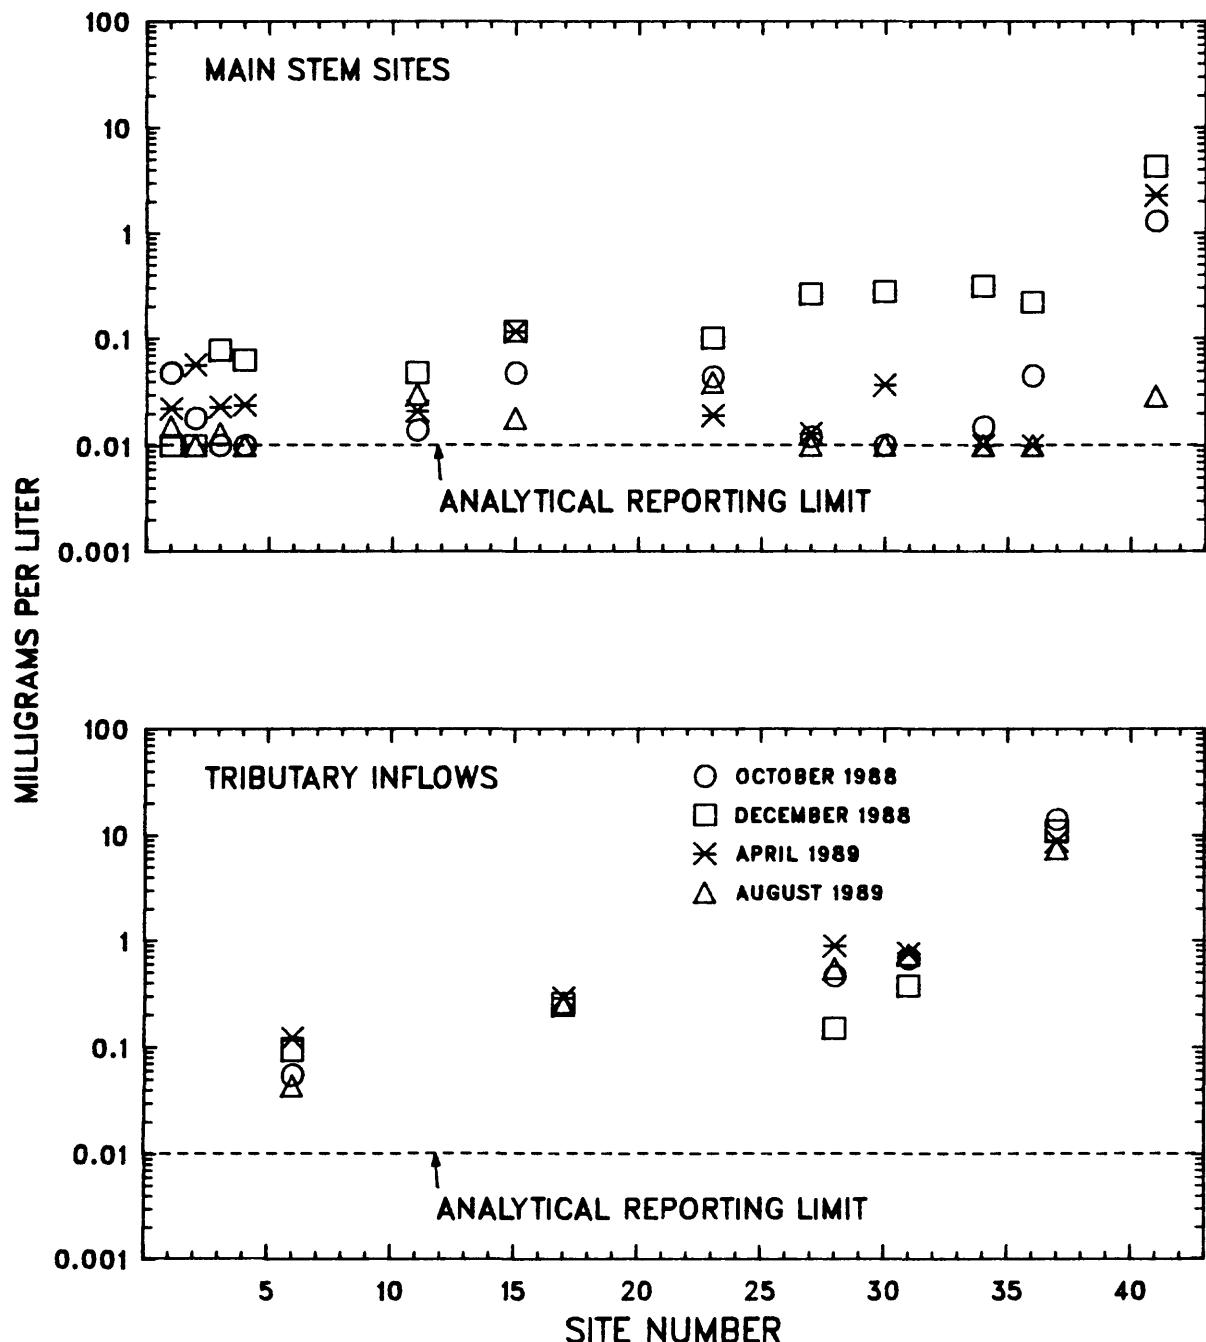

Figure 10.--Dissolved nitrite plus nitrate (as nitrogen) for synoptic sampling of sites on and adjacent to Rapid Creek.

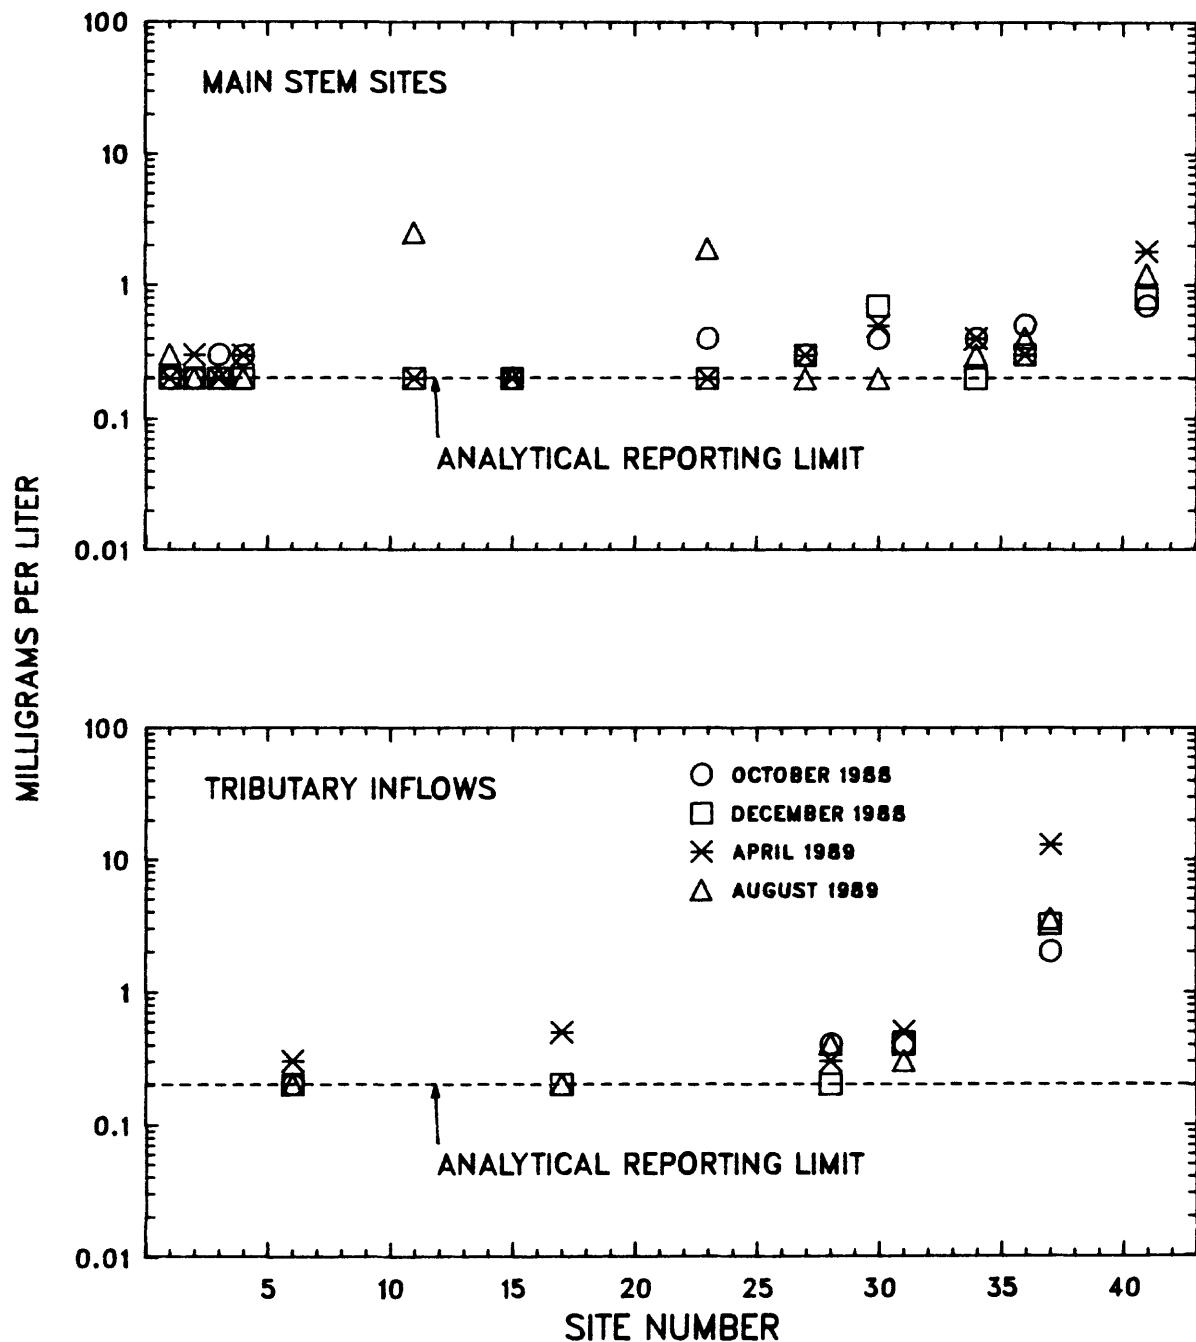

Figure 11.—Total ammonia plus organic nitrogen for synoptic sampling of sites on and adjacent to Rapid Creek.

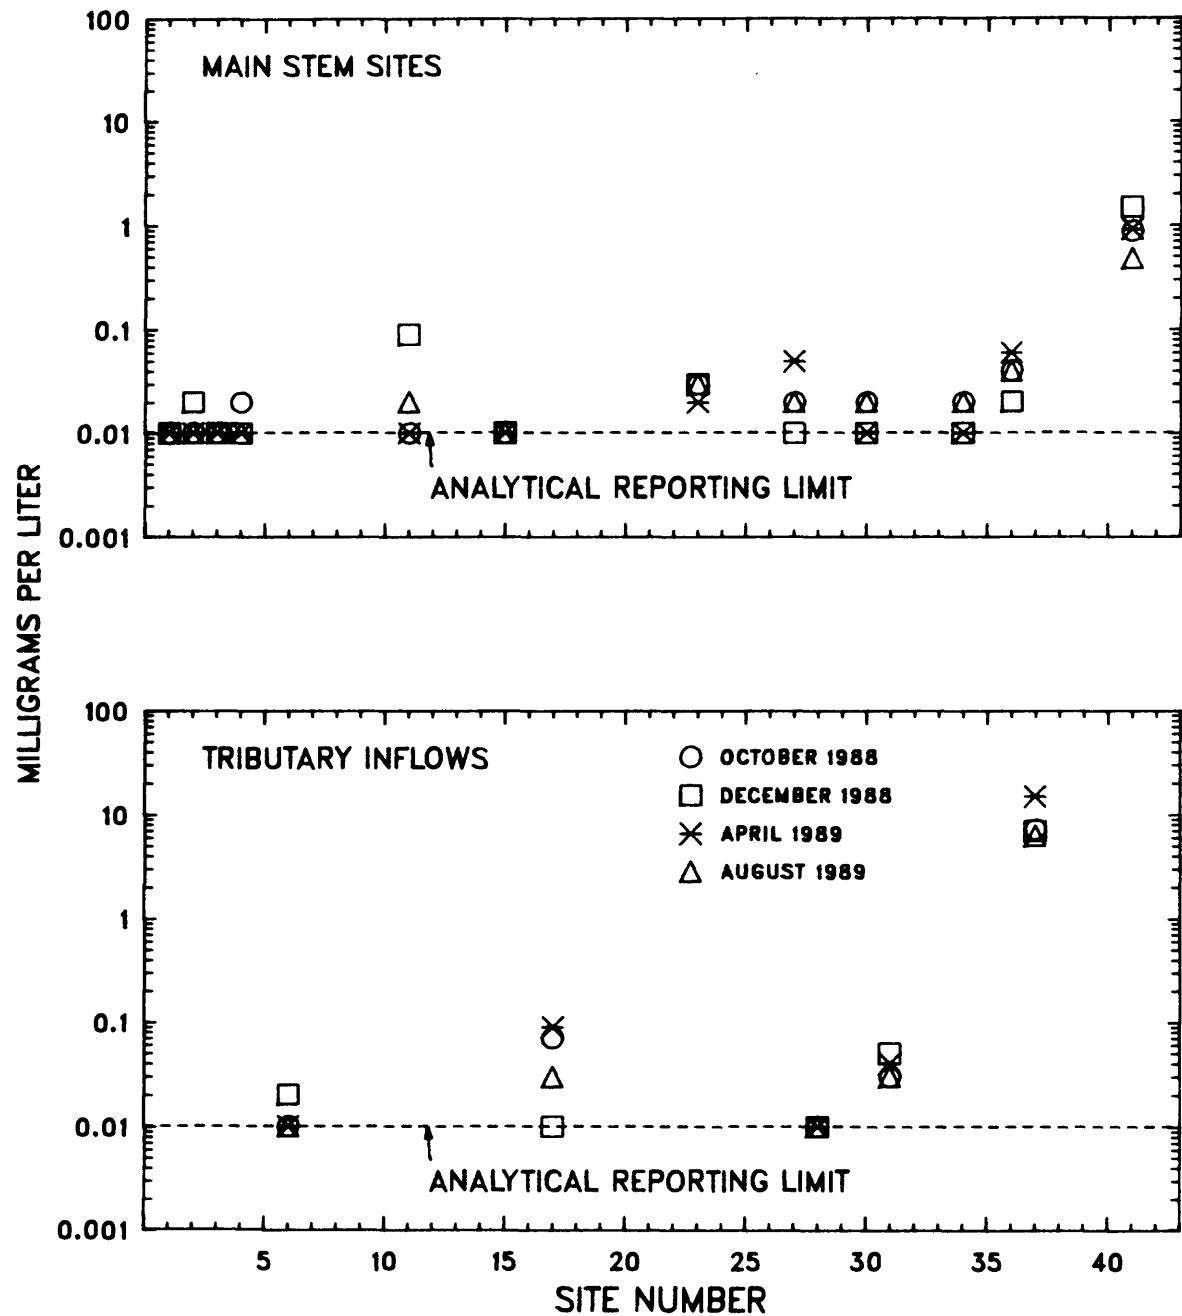

Figure 12.--Total phosphorous for synoptic sampling of sites on and adjacent to Rapid Creek.

**TABLES OF DISCHARGE AND WATER-QUALITY DATA**

Table 2.--Chemical analyses of selected surface-water samples collected and analyzed by the U.S. Geological Survey at stations within the Rapid Creek basin downstream of Pactola Reservoir
